

SYSTEM, METHOD AND COMPUTER PROGRAM PRODUCT FOR MONITORING SUPPLIER ACTIVITY IN A SUPPLY CHAIN MANAGEMENT FRAMEWORK

5

ABSTRACT

A system, method and computer program product are disclosed for monitoring supplier activity in a supply chain management framework. Data relating to the sale of goods is received from at least one store of a supply chain utilizing a network. Electronic order forms are generated based on the data for ordering goods from a plurality of suppliers of the supply chain. The electronic order forms are sent to the suppliers so that the goods are supplied to the stores. The electronic order forms for each of the suppliers are then compared for monitoring the reliance of the store on each supplier.
